METER SIZING FOR P, PX, T, TX AND S METERS

Flow capacity tables 6, 7, 8, 9 and 10 (pages 61 to 64) are based on calibrations at standard conditions, meaning 14.7 psia (1 atm) pressure and 70 °F (21.1 °C).

Tables list maximum flow rates of flow tubes. The usable range of meters is at least 10:1, often more. Thus, as a rule of thumb, to estimate the minimum metering limit divide the flow rates listed, by ten.

For gases or liquids with fluid properties not greatly different from the calibration media, tables apply directly, when working pressure and temperature are also approximately standard.

Where the above conditions do not apply the maximum flow rates of the metered fluids are converted to equivalent standard flow rates of air or water.

To do this calculate “K” as shown in charts, multiply the maximum flow rate with this factor, and select the appropriate flow tube size from the Flow Capacity tables 6, 7, 8, 9 and 10 (pages 61 to 64).

gas flow

$$Q_{\text{air}} = K_{\text{gas}} \times Q_{\text{gas}}$$

$$K_{\text{gas}} = \sqrt{G \times \frac{T_{\text{act}}}{T_0} \times \frac{P_0}{P_{\text{act}}}}$$

where:

- Q_{air} = equivalent air flow capacity at Standard Conditions (SPT).
- Q_{gas} = maximum flow of metered gas.
- G = specific gravity of metered gas (from table 5).
- T_{act} = absolute temperature at flow condition, deg R or deg K.
- T_0 = absolute temperature at Standard Conditions. (STP) deg R (530) or deg K (294).
- P_{act} = pressure at flow conditions, psia.
- P_0 = pressure at Standard Conditions (STP), (14.7 psia).

liquid flow

$$Q_{\text{water}} = K_{\text{liq}} \times Q_{\text{liq}}$$

$$K_{\text{liq}} = \sqrt{\frac{(d_F - d_W)}{(d_F - d_L)} \times \frac{d_L}{d_W}}$$

where:

- Q_{water} = equivalent water flow capacity at Standard Conditions (STP).
- Q_{liq} = maximum flow of metered liquid.
- d_F = density of float selected, (see table 3), (g/ml).
- d_L = density of metered liquid, (g/ml).
- d_W = density of water at Standard Conditions (STP) (1.0 g/ml).

CALCULATION VS. CALIBRATION FOR P, PX, S, T AND TX METERS

In case of liquid flows at each major point along the scale, sample volumes are collected in a buret of a volumetric flask during measured time intervals. Volumes are interpolated to a unit of time such as for example [mL/min] or [cu. ft/hr] etc. A table or a graph is then constructed to establish a complete set of calibration data. In case of gas flows, calibration data can be similarly developed, except that collection of sample volumes is accomplished by means of gas sampling devices, the simplest of which is a “soap bubble” meter.

It is very important that the correction factors as calculated from the accompanying equations are used for sizing only. These relationships are greatly simplified and will not provide precise predictable flow corrections. It is always best practice to calibrate meters for non-standard conditions on site, by using reliable means of calibration.
