ΗΙΟΚΙ

POWER QUALITY ANALYZER PW3198

Record and Analyze Power Supply Problems Simultaneously with a Single Unit The New World Standard for Power Quality Analysis

Never Miss the Moment

- Detect power supply problems and perform onsite troubleshooting
- Do preventive maintenance to avert accidents by managing the power quality

CAT IV-600V Safety Standard

- Meets the CAT IV safety rating required to check an incoming power line
- Safe enough to measure up to 6,000Vpeak of transient overvoltage

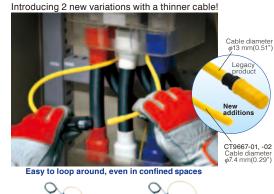

Easy Setup Function with PRESETS

- Just select the measurement course, wiring, and clamps
- Automatic one-step setup based on measurement conditions

Compliant with International Standards

- International power quality measurement standard IEC 61000-4-30 Edition 2 Class A
- High precision with a basic voltage measurement accuracy of 0.1%

AC FLEXIBLE CURRENT SENSOR

One Single Unit Can Solve All Your Power Supply Problems

The number of power supply problems is increasing as power systems are becoming more and more complicated all due to the rising use of power electronics devices plus a growing installed base of large systems and distributed power supplies. The quickest way to approach these problems is to understand the situation quickly and accurately. The PW3198 Power Quality Analyzer is ready to effectively solve your power supply problems.

Troubleshooting

- Understand the actual power situation at the site where the problem is occurring (e.g., the equipment malfunction, failure, reset, overheating, or burning damage).
- Ideal for troubleshooting solar and wind power generation systems, EV charge stations, smart grids, tooling machines, OA equipment (e.g., computers, printers, and UPS), medical equipment, server rooms, and electrical equipment (e.g., transformers and phase-advancing capacitors).

Field Survey and Preventive Maintenance

- Perform long-term measurements of the power quality and study problems that are difficult to detect or that occur intermittently.
- ✓ Maintain electrical equipment and check the operation of solar and wind power generation systems.
- Manage the parameters with a control set point, such as a voltage fluctuation, flicker, and harmonic voltage.

Power (Load) Survey

✓ Study the power consumption and confirm system capacity before adding load.

Advanced Features for Safe, Simple, and Accurate Measurements

International Standard IEC61000-4-30 Edition 2 Class A

Class A is defined in the international standard IEC61000-4-30, which specifies compatibility with power quality parameters, accuracy, and standards to enable comparison and discussion of the measurement results of different measuring instruments.

The PW3198 is compliant with IEC61000-4-30 Edition 2 Class A standard. The instrument can perform measurements in accordance with the standard, including continuous gapless calculation, methods to detect events such as dip, swell, and instantaneous power failure, and time synchronization using the optional GPS box.

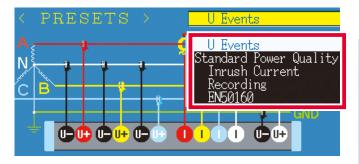

CAT IV-600V Safety

The PW3198 is compliant with the measurement category CAT IV - 600V and can also safely test the incoming lines for both single-phase and three-phase power supplies.

Easy to set up - Just select the measurement course and the PW3198 will do the rest

Simply choose the course based on the measurement objective and the necessary configurations will be set automatically.

U Events	Record voltage and frequency and detect errors simultaneously.
Standard Power Quality	Record voltage, current, frequency, and harmonic, and detect errors simultaneously.
Inrush current	Measure the inrush current.
Recording	Record only the TIME PLOT Data but do not detect errors.
EN50160	Perform measurements in accordance with EN50160.

Highly Accurate, Broadband, Wide Dynamic Range Makes for Reliable Measurements

DC

Voltage Frequency Range

Harmonic measurement

High-order harmonic measurement

3kHz

Wide range from DC voltage to 700 kHz

Voltage Measurement Range

		Transient	overvoltage
	Line-to-line volta	age (3P4W)	
Line-to-line voltage (1P2W, 1P3 Phase voltage (1P2W, 1P3			
	780V	1300V	6000Vpea
Rath low and high valt		a a urad in a aina	

Both low and high voltages can be measured in a single range.

Basic Measurement Accuracy (50/60 Hz)

Voltage	±0.1% of nominal voltage
Current	±0.2% rdg. ±0.1% f.s. + Clamp-on sensor accuracy
Power	±0.2% rdg. ±0.1% f.s. + Clamp-on sensor accuracy

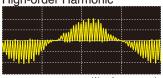

World's highest level of basic measurement accuracy. Extremely accurate voltage measurement without the need to switch ranges.

Transient overvoltage can also be measured The PW3198 is the first power in a range between the maximum 6,000 V and minimum 0.5 µs (2 MS/s).

High-order Harmonic

80kHz

Transient overvoltage detection

Waveform example

700kHz

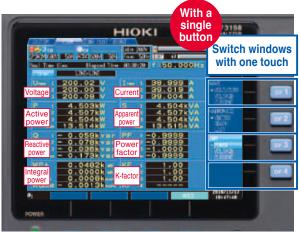

quality analyzer that can measure the high-order harmonic component of up to 80 kHz.

✓ PW3198 Never Misses the Moment a Power Supply Failure Occurs

The PW3198 can measure all waveforms of power, harmonic, and error events simultaneously. When a problem occurs with the equipment or system on your site, the PW3198 will help you detect the cause of the problem early and solve it quickly. You can depend on the PW3198 to monitor all aspects of your power supplies.

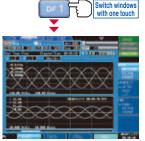

Measure All Parameters at the Same Time

Acquire the Information You Need Quickly by Switching Pages (RMS Value) Just connect to the measurement line, and the PW3198 will simultaneously measure all parameters, such as power and harmonic. You can then switch pages to view the needed information immediately.

DMM Display

Display parameters such as voltage, current, power, power factor, and integral power in a single window.

Waveform Display

Display the voltage and current waveforms on channels 1 to 4 one above the other in a single window.

4-channel Waveform Display Display the voltage and current waveforms on channels 1 to 4 individually.

Switch windows

Vector Display

Display the measured value and vector of the voltage and current of each order harmonic

Harmonic Bar Graph Display Display the RMS value and phase angle of harmonics from the 0th order to the 50th either in a graph or as numerical values.

Reliably Detect Power Supply Failures (Event)

To detect power supply failures, measurement does not need to be performed multiple times under different conditions. The PW3198 can always monitor and reliably detect all power supply failures for which detection is enabled.

Transient Overvoltage (Impulse)

A transient overvoltage is generated by a lightning strike or a contact fault or closed contact of a circuit breaker and relay, and often causes a steep voltage change and a high voltage peak.

Voltage Dip (Voltage Drop)

Voltage drops for a short time as a result of large inrush current generated in the load by, for example, a starting

$\Lambda \Lambda \Lambda$	IN IN
\mathbb{V} \mathbb{V} \mathbb{V} \mathbb{V} \mathbb{V} \mathbb{V}	\mathbb{V}

Interruption

The power supply stops instantaneously or for a short or long time because electrical power transmission is stopped as a result of a lightning strike, or because the circuit breaker is tripped by a power supply short

Frequency Fluctuations

An excessive increase or decrease of the load causes the operation of a generator to become unstable, resulting in frequency fluctuations.

Harmonic

Harmonic is generated by a semiconductor control device installed in the power supply of equipment, causing distortion of voltage and current waveforms.

Â	\int		Â		A		1		ſ	-	f		Ĥ		Λ		Λ		Λ		\wedge
	V.	V		V		V										V		Ų		Û	
								V		V		V		V							

Voltage Swell (Voltage Rise)

A voltage swell is generated by a lightning strike or a heavily loaded power line being opened or closed, causing the voltage to rise instantaneous-

Inrush Current

A large current flows instantaneously at the moment electrical equipment, a motor, or similar devices are powered on.

nigh order narmonie

Voltage and current waveforms are distorted by noise components generated by a semiconductor control device or the like installed in the power supply of electronic equipment.

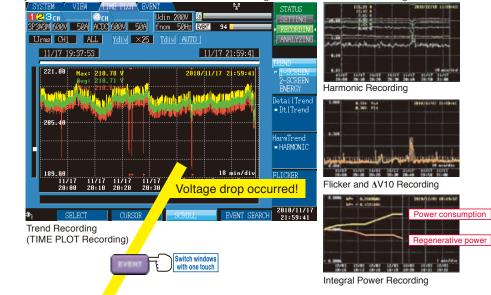

An increase or decrease in the load connected to each phase of the three-phase power supply or an unbalanced operation of equipment and devices causes the load of a particular phase to become heavy so that voltage and current waveforms are distorted, voltage drops, or negative phase sequence voltage is generated.

Simultaneous Recording of TIME PLOT Data and Event Waveforms

TIME PLOT Data

TIME PLOT Recording of All Parameters

The PW3198 can simultaneously record 8,000 or more parameters, such as voltage, current, power, power factor, frequency, integral power, harmonic, and flicker, at the specified recording interval. The PW3198 never fails to capture the peak because it performs calculations continuously and records the maximum, minimum, and average values within the recording interval.

Event Waveforms

Capture up to 55,000 Instantaneous Waveforms of Power Supply Failures

The PW3198 can record up to 1,000 instantaneous waveforms of power supply failures (up to 55,000 when repeat recording is set to ON) while performing TIME PLOT recording.

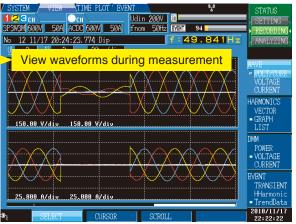

This list records instantaneous waveforms of power supply failures

(events), such as a voltage drop or inrush current, along with the

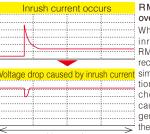

time or other information. Events are always monitored, regardless of

the recording interval of the TIME PLOT recording.

Event Waveform

The PW3198 lets you view the instantaneous waveform (200 ms) of a power supply failure in the window.

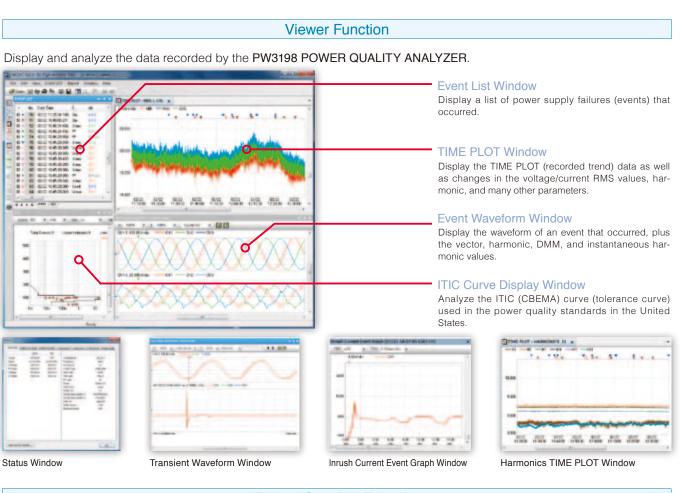

RMS value changes over 30 seconds

When a voltage drop or inrush current occurs, RMS value changes are recorded over 30 seconds simultaneously. This function can also be used to check the voltage drop caused by inrush current generated by the start of the motor.

30 seconds

Use Model 9624-50 PQA-HiVIEW PRO (version 2.00 or later) with a PC to analyze the data collected by the PW3198.

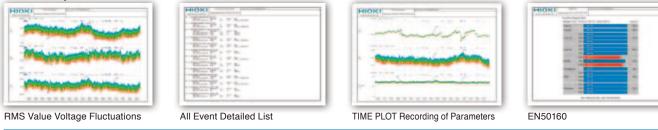

Report Creation Function

Automatically and effortlessly create rich reports for compliance and record management. Report output items: Voltage/current RMS value fluctuation graph, harmonic fluctuation graph, inter-harmonics fluctuation graph, flicker graph, integral power graph, demand graph, total harmonic voltage/current distortion rate list, EN50160 window (Overview, Harmonic, Measurement Results Category), worst case, transient waveform,

maximum/minimum value list, all event waveforms/detailed list, and setup list

Print Examples

Other Functions

Othe

Download Measurement Data via USB/LAN

Data in the SD memory card inserted in the PW3198 can be downloaded to a PC via USB or LAN.

EN50160 Display Function

EN50160 is a power quality standard for the EU. In this mode, evaluate and analyze power quality in accordance with the standard. You can display the Overview, Harmonic, and Measurement Results Category windows.

9624-50 Specifications

Delivery media	CD-R
Operating environment	AT-compatible PC
OS	Windows10, Windows8, Windows7
Memory	512 MB or more

CSV Conversion of Measurement Data

Convert data in the range specified in the TIME PLOT window into CSV format and then save for further processing. The 9624-50 can also convert event waveforms into CSV format. Open CSV data using any commercially available spreadsheet software for advanced data management and analysis.

Even Analyze Data Recorded with Models 3196 and 3197 PQAs Data recorded with the HIOKI 3196 and 3197 Power Quality Analyzers can also be analyzed.

Large Capacity Recording with SD memory card

Data is recorded to a large capacity SD memory card. The data can be transferred to a PC and analyzed using dedicated application software. If your PC is not equipped with an SD memory card slot, simply connect a USB cable between the PW3198 and the PC. The PC will then recognize the SD memory card as removable media.

OFF	Max. 35 days Reference value: ALL DATA (all items recorded), repeat record- ing OFF, and TIME PLOT interval 1 minute or longer)
ON	Max. 55 weeks (about 1 year) Reference value: ALL DATA (all items recorded), repeat recording ON (1 week x 55 times), and TIME PLOT interval 10 minutes or lon- der)

Remote Measurement Using HTTP Server Function

You can use any Internet browser to remotely operate the PW3198, plus download the data stored in the SD memory card using dedicated software (LAN access required).

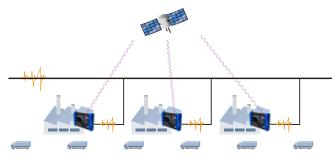

Conduct off-site remote control with a tablet PC using a wireless LAN router

GPS Time Synchronization

The PW9005 GPS BOX lets you synchronize the clock on the PW3198 to the UTC standard time. Eliminate time differences between multiple PQAs and correctly analyze measurement data taken by several instruments.

Simultaneously Measure Three-phase Lines and Grounding Wire

Apart from the main measurement line, you can also measure the AC/DC voltage on another line using Channel 4.

Yes! Simultaneously!

•Measure the primary and secondary sides of UPS •Two-line voltage analysis

•Measure three-phase lines and grounding wire

•Measure neutral lines to detect short circuits

Measure the input and output of a DC-AC converter for solar power generation

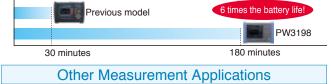

An Assortment of Clamp-on Sensors Covers a Broad Range of Measurements

In addition to current sensors for measuring 100A AC, 500A AC, 1000A AC and 5000A AC rated currents, a 5A AC sensor is also available. In addition, HIOKI's CLAMP ON LEAK SENSORS enable you to accurately measure for leakage current down to the mA level, while the new CT7700 AC/DC AUTO-ZERO CURRENT SENSOR further widen applications by supporting DC current testing.

Backup and Recovery from Power Failure

The PW3198 uses the new large capacity BATTERY PACK Z1003, enabling continuous measurement for three hours even if a power failure occurs. In addition, a power failure processing function restarts measurement automatically even if the power is cut off completely during measurement.

Flicker measurement

Measure flicker in conformance with IEC 61000-4-15 Ed2. Phase voltage check for Δ connection

Use the Δ -Y and Y- Δ conversion function to measure phase voltage using a virtual neutral point.

400 Hz line measurement

Measure at a power line frequency of 50/60 Hz as well as 400 Hz.

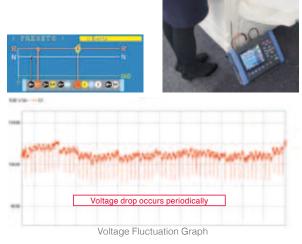

Power Quality Survey Applications

The power supply of the office equipment sometimes shuts down

Survey Objective The power supply of a printer at the office shuts down even though it is not operated. Equipment other than the printer can also sometimes perform a reset unexpectedly.

easurement Method

Measurement wears and Setup is very easy. Just install the PW3198 on the site, and measure the voltage, current, and power. To troubleshoot, just select the clamp-on sensor and wiring, and then select the "U Events" course

A nalysis Report

No failure occurred during the measurement period, but a periodic voltage drop was confirmed. The voltage drop may have been caused by the periodic start and operation of the electrical equipment connected to the power supply line. Equipment, such as a laser printer, copier, and electrical heater, may start themselves periodically due to residual heat. An instantaneous voltage drop is likely to have been caused by inrush current from equipment that consumes a large amount of power.

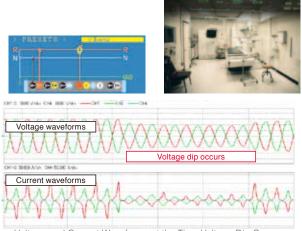

Medical equipment malfunctions

Curvey Objective

OReplacing the equipment with a new one by the service provider did not improve the malfunction. A survey of the power supply was required to clarify the cause.

easurement Method

NSelect the "U Events" course in the PW3198 in the same way as with the office equipment example.

Voltage and Current Waveforms at the Time Voltage Dip Occurs

A nalysis Report It was determined that a voltage dip (voltage drop) occurred and impacted the operation of the equipment. If a voltage dip occurs every day on a regular basis, the probable cause is the start of a large air-conditioning unit, pump, heater, or similar equipment.

Surveying a Solar Power Generation System

S^{urvey Objective}

- Maintain a solar power generation system and check its operation (verify the power quality)
- Troubleshoot (impact on the peripheral equipment, operation shutdown, etc.)

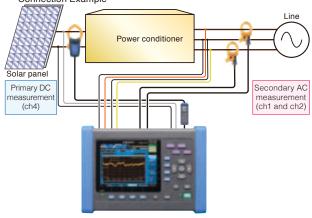

easurement Method

Neasurement weared rent, and power. To survey the power quality, select the "Standard power quality measurement" course in the PRESETS menu. To measure the DC voltage, connect channel 4 to the primary

side of the solar panel.

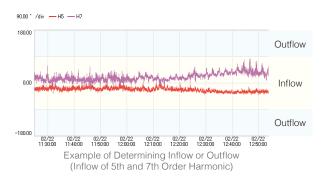

Connection Example

Example of Voltage Waveforms at the Time of Line Switching

- Analysis Report All parameters can be recorded simultaneously with a single measurement.
- Identify changes in the output voltage of the power conditioner
- · Presence or absence of the occurrence of a transient overvoltage
- Frequency fluctuation important for system interconnection
- Identify changes in the harmonic voltage and current included in the output
- Power (AC), integral power (AC), etc.

Measurement method	Detected from waveform obtained by eliminating the fundamental component (50/60/400 Hz) from the sampled waveform	
Sampling frequency	2MHz	
leasurement range, resolution	±6.0000kVpeak, 0.0001kV	
leasurement bandwidth	5 kHz (-3dB) to 700 kHz (-3dB)	
In. detection width	0.5 µs	
leasurement accuracy	±5.0% rdg.±1.0%f.s.	
MS voltage/ RMS current re		
leasurement method	RMS voltage refreshed each half-cycle : True RMS type, RMS voltage values are calculated using sample data for 1 waveform derived by overlapping the voltage waveform every half-cycle	
	RMS current refreshed each half-cycle : RMS current is calculated using current waveform data sampled every half-cycle	
ampling frequency		
leasurement range, resolution	RMS voltage refreshed each half-cycle : 600.00V, 0.01V RMS current refreshed each half-cycle : Based on clamp-on sensor in use; see Input specifications	
leasurement accuracy	RMS voltage refreshed each half-cycle : ±0.2% of nominal voltage (With 1.666% f.s. to 110% f.s. input and a nominal input voltage of at least 100 V) ±0.2%rdg.±0.08%f.s. (With input outside the range of 1.666% f.s. to 110% f.s. or a nominal input voltage of less than 100 V)	
	RMS current refreshed each half-cycle : ±0.3% rdg.±0.5% f.s. + clamp-on sensor accuracy	
well/ Dip/ Interruption	FLUCTUATION	
Display item	Swell : Swell height, Swell duration	
	Dip : Dip depth, Dip duration Interruption : Interruption depth, Interruption duration	
leasurement method	Swell : A swell is detected when the RMS voltage refreshed each half-cycle exceeds the threshold in the positive direction	
	Dip : A dip is detected when the RMS voltage refreshed each half-cycle exceeds the threshold in the negative direction Interruption : An interruption is detected when the RMS voltage refreshed each half-cycle exceeds the threshold in the negative direction	
ange and accuracy	See RMS voltage refreshed each half-cycle	
, ,	FLUCTUATION EVENT	
rush current isplay item	Maximum current of RMS current refreshed each 1/2 cycle	
leasurement method ange and accuracy	Detected when the RMS current refreshed each 1/2 cycle exceeds the threshold in a positive direction See RMS current refreshed each half-cycle	
· · · ·		
MS voltage, RMS current	TIME PLOT EVENT	
Display items	RMS voltage : RMS voltage for each channel and AVG (average) RMS voltage for multiple channels RMS current : RMS current for each channel and AVG (average) RMS current for multiple channels	
leasurement method	AC+DC True RMS type (Current DC value: when using compatible sensor) RMS value calculated from 10 cycles (50 Hz) or 12 cycles (60 Hz)	
Sampling frequency	200kHz	
leasurement range, resolution	RMS voltage : 600.00V, 0.01V RMS current : Based on clamp-on sensor in use; see Input specifications	
leasurement accuracy	RMS voltage: ±0.1% of nominal voltage (With 1.666% f.s. to 110% f.s. input and a nominal input voltage of at least 100 V) ±0.2%rdg.±0.08%f.s. (With input outside the range of 1.666% f.s. to 110% f.s. or a nominal input voltage of less than 100	
	RMS current : $\pm 0.2\%$ rdg. $\pm 0.1\%$ f.s. + clamp-on sensor accuracy	
oltage waveform peak/ Curi	rent waveform peak	
Display item	Positive peak value and negative peak value	
leasurement method	Measured every 10 cycles (50 Hz) or 12 cycles (60 Hz)	
I' <i>f</i>	maximum and minimum points sampled during approx. 200 ms aggregation	
ampling frequency leasurement range, resolution	200kHz Voltage waveform peak : ±1200.0 Vpeak, 0.1V	
neasurement range, resolution	Current waveform peak : The quadruple of RMS current measurement range (Based on clamp-on sensor in use; See Input specifications)	
oltage waveform compariso	DN EVENT	
Display item	Event detection only	
leasurement method	A judgment area is automatically generated from the previous 200 ms aggregation waveform, and events are generated based of a comparison with the judgment waveform. Waveform judgments are performed once for each 200 ms aggregation.	
Comparison window width	10 cycles (50 Hz), 12 cycles (60 Hz)	
lo. of window points	4096 points synchronized with harmonic calculations	
	TIME PLOT EVENT	
requency cycle leasurement method	Calculated as the reciprocal of the accumulated whole-cycle time during one U1 (reference channel) cycle	
	70.000Hz, 0.001Hz	
leasurement range recolution

Display items	THD-F (total harmonic distortion factor for the fundamental wave)		
	THD-R (total harmonic distortion factor for the total harmonic including the fundamental wave)		
Measurement method	Based on IEC61000-4-7:2002; Max. order: 50th		
Comparison window width	10 cycles (50 Hz), 12 cycles (60 Hz)		
No. of window points	4096 points synchronized with harmonic calculations		
Measurement range, resolution	0.00 to 100.00%(Voltage), 0.00 to 5	500.00%(Current)	
leasurement accuracy	—		
larmonic power (including fu	undamental component)	TIME PLOT EVENT	
Display item	Select either RMS or content percentage; From 0 to 50th order		
Measurement method	Uses IEC61000-4-7:2002.		
Comparison window width	10 cycles (50 Hz), 12 cycles (60 Hz	z)	
lo. of window points	4096 points synchronized with harr	monic calculations	
leasurement range, resolution	Depends on the voltage × current r	range combination; See Input specifications	
leasurement accuracy	See measurement accuracy with a fundame	ental wave of 50/60 Hz (When using an AC-only clamp sensor, order 0 is not specified for current and power)	
	Measurement accuracy with a	fundamental wave of 50/60 Hz	
	Harmonic input	Measurement accuracy	
	Voltage	Specified with a nominal voltage of at least 100 V	
	(At least 1% of nominal voltage)	Order 0: ±0.3%rdg.±0.08%f.s. Order 1+: ±5.00%rdg	
	Voltage	Specified with a nominal voltage of at least 100 V	
	(<1% of nominal voltage)	Order 0: ±0.3%rdg.±0.08%f.s.	
		Order 1+: ±0.05% of nominal voltage	
	Current	Order 0: ±0.5%rdg.±0.5%f.s. +clamp-on sensor accuracy Order 1 to 20th: ±0.5%rdg.±0.2%f.s. +clamp-on sensor accuracy	
		Order 21 to 50th: $\pm 1.0\%$ rdg. $\pm 0.3\%$ f.s. $\pm clamp-on sensor accuracy$	
	Power	Order 0: ±0.5%rdg.±0.5%f.s. +clamp-on sensor accuracy	
		Order 1 to 20th: ±0.5%rdg.±0.2%f.s. +clamp-on sensor accuracy Order 21 to 30th: ±1.0%rdg.±0.3%f.s. +clamp-on sensor accuracy	
		Order 21 to 30th: ±1.0%rdg.±0.3%f.s. +clamp-on sensor accuracy Order 31 to 40th: ±2.0%rdg.±0.3%f.s. +clamp-on sensor accuracy	
		Order 41 to 50th: ±3.0%rdg.±0.3%f.s. +clamp-on sensor accuracy	
larmonic voltage phase and	gle/ Harmonic current phase and	gle (including fundamental component)	
Display item	Harmonic phase angle components		
leasurement method	Uses IEC61000-4-7:2002.		
Comparison window width	10 cycles (50 Hz), 12 cycles (60 Hz	z)	
Jo. of window points	4096 points synchronized with harr		
leasurement range, resolution	-180.00° to 0.00° to 180.00°		
leasurement accuracy	_		
,	ase angle (including fundament	tal component) TIME PLOT EVENT	
Display item		the harmonic voltage phase angle and the harmonic current phase angle.	
Display item		ifference for each channel and sum (total) value for multiple channels	
Aeasurement method	Uses IEC61000-4-7:2002.		
Comparison window width	10 cycles (50 Hz), 12 cycles (60 Hz	2)	
Vo. of window points	4096 points synchronized with harr
