Paddle Wheel Flow Sensors DF Series

Description

The main feature of the DF flow sensors is the incorporation of a multipole magnet ring embedded into the paddlewheel. As the paddle wheel rotates, the magnets, hermetically separated from the liquid media, induce a DC signal into a Hall-Effect sensor mounted on the device housing. Since the DC signal frequency is proportional to paddlewheel rotation, an accurate flow rate reading is possible.

The DF sensors, when coupled with the appropriate KOBOLD electronics unit, can offer the user a number of features useful in the measurement and control of low viscosity liquid flow. These features include a frequency output, analog output, adjustable switches, digital displays with integrated batch controllers, or totalizers.

Specifications

Accuracy:	± 2.5% of full scale
Media:	Water and low viscosity liquids
Orientation:	Universal
Fittings:	1/8" NPT ... 1-1/2" NPT

Description

The KOBOLD DF Flow Sensor is used in applications where flow measurement is desired and flow rate data is to be transmitted as a pulse rate output. The DF Flow Sensor contains a flow transducer which transmits a pulse signal. The output signal is linearly proportional to the flow and is transmitted by a bipolar transistor operating in an open collector configuration (max. 10 mA sinking capability). A user-supplied, pull-up resistor is required to produce a signal output.

Specifications

Power Supply:	5 to 24 V _{DC}
Signal Output:	NPN - Open Collector 10 mA max.
Temperature Range:	-4...176 °F (140 °F for DF-01..)
Protection:	IP 65
Accuracy:	± 2.5% of F.S.
